WOOD'S CROP SPECIAL

Giving Timely Information and Prices of Seasonable Seeds

PUBLISHED BY T.W. WOOD & SONS SEEDSMEN RICHMOND VA.

VOL. XXXI.

APRIL EDITION

1936

Wood's Pamunkey Ensilage at New Haven, Conn., averaged 21 tons per acre in a five-year test, outyielding forty varieties.

Wood's Virginia Grown ENSILAGE CORN

Are world renowned for large growth of stalk, heavy fodder and tonnage production. Every bushel of Wood's Famous Ensilage Corn is natural field matured, of strong vitality and testing well over 90% germination. In a five-year summary of silage corn tests in nine states, Wood's Ensilage Corns head all others in average tons produced per acre.

All of our seed corn, both ensilage and field varieties, are treated with Improved Semesan, Jr., at no additional cost. This treatment increases the yield, hastens and increases germination, protects corn from rotting, allows earlier planting and produces sturdier stalks. Also controls seeding blight and reduces root rot.

HIGH YIELDING FIELD VARIETIES

Practically the entire list of field corns which we offer are grown under contract by most reliable growers from especially selected and certified strains. A complete list of varieties given in this Crop Special. Full information will be found in our 1936 Catalog.

Note:—Practically all the corn produced in the middle western and northern states contains a large moisture content of low germination and unsuitable for seed purposes. All early maturing strains as well as ensilage corns suitable for these localities are in heavy demand and stocks limited. Early purchases while the best strains are available is important this year.

Wood's Tested Garden Seeds Produce Bountiful Gardens

If you want early vegetables this summer its time you were getting the soil in perfect condition and sowing your seeds. April is the ideal month for

planting both vegetable and flower seeds. By the time the tender sprouts are peeping above ground, all danger of frost will be over.

You will get much enjoyment and satisfaction from growing Wood's Tested Garden Seed. They will help you realize your ambition for an earlier garden, for perfect, finer flavored vegetables and bountiful yields.

The freshest vegetables on the market are never as fresh as those newly picked from your garden. And what a difference there is in the flavor.

Full Measure Beans.

New A.A.A. Program

Is greatly increasing the demand for all legume seeds. Watch the newspapers and see your local county committee for full details. This new program will cause an enormous demand for Cow Peas and Soja Beans. Prices are advancing and stocks in short supply. Early purchases advisable.

Certified Boone County

Certified Boone County Matures in 125 days; roasting ears in 90 days; 9 feet tall. Our strain is far superior to ordinary Boone County in soundness, yield and beautiful show type ears. The Kentucky Experiment Station says: "It yielded 5 bushels per acre more than commercial Boone bought locally." It has a record unequalled in Virginia, having won most of the important prizes for white corn for over thirty years. Magnificent ears, 10 to 11 inches long; 18 straight rows of deep grain. It made the highest yield in a nine-year test at Holland, Va., Experiment station, and in a three-year Virginia Mountain test averaged 60 bushels to the acre.

Lancaster Surecrop One of the heaviest grain producing corns for mountain sections, and popular in Northern States because it produces tremendous yields of grain and silage before frost. Makes the largest ear of any early corn, averaging a foot long. Grain is reddish golden color. For two years it made the highest yield of any corn in both the Staunton and Blacksburg, Va., tests; 61 bushels per acre. It averaged 71 bushels of grain per acre, and made the highest yield of ensilage on a dry weight basis in four-year tests in Ohio.

Wood's Old Virginia Ensilage We are introducing our new improved strain which for two years has been even as tall and produced about as much silage and grain to the acre as Pamunkey and Eureka Ensilage. It produced more grain and silage than any other ensilage corn in a four-year Williamsburg, Va., Experiment Station test, averaging 72 bushels per acre. Two of the largest farmers in North Carolina grew our new strain last year and both pronounced it the tallest and largest stalk and biggest ear they ever saw. The Delaware State Experiment Station says: "For years Wood's Virginia Ensilage has out-yielded all other varieties in our tests."

Wood's Dixie Matures in 125 days; delicious roasting ears in 88 days; nine feet tall. No southern prolific corn has a longer record for high yields. It makes two large, sound ears on each stalk, 16 rows of broad, deep, flinty grain on a small white cob. Shells 87% grain. Shorter, stronger stalk than most prolific corns. Resistant to smut and rust rot. In 1935 it yielded 85 bushels per acre of sound corn at the Kentucky Experiment Station. It averaged 80 bushels per acre, the highest yield of 40 varieties in a four-year test at Williamsburg, Va. Made the highest yield of any white variety in three-year test at both Chatham, Va., and Holland, Va., averaging 69 bushels per acre. In 1933 it made the highest yield at all four S. C. State Experiment Stations. The S. C. Coast Experiment Station says: "Wood's Dixie made the highest yield ever tested here in 1933, and the highest average yield for three years. Weevil-resistant, heavy long shuck protecting the ears. Large ear and grain. Earlier than other prolific corns; can be planted later, avoiding wire-worm damage."

Certified Wood's Improved White Dent

Matures in 125 days; roasting ears in 90 days; 9 feet tall. One of the heaviest yielding general purpose corns. Adapted to a wide range of soils, climates and uses. Very popular with the Southern truckers as its beautiful large ears bring the top market price. Ears 11 inches long with 18 rows of broad, deep grain set close on a medium small cob. Tip and butt well covered with grain. Strong, vigorous stalk and foliage. Storm-resistant. The long, tight shuck extends 1.6 inches beyond the tip of the ear, protecting it from insect and weather damage. It did not show a single unsound ear last summer when the continued storms damaged other varieties from 10 to 60%. No variety has a longer record of higher performance at the Virginia State Experiment Stations. It yielded 98 bushels per acre, highest of 28 varieties in the Williamsburg, Va., 1932, test, and 61 bushels per acre, the highest yielding white corn in the Appomattox, Va., eight-year test, and in the Bowling Green, Va., test.

Hickory King Matures in 125 days; roasting ears in 88 days; 8 feet tall. The most dependable corn on poor land or in adverse conditions or seasons. Shuck extends over two inches beyond end of ear. The grain is so large and the cob so small that a single grain will cover the end of a broken cob. Our improved stock is the pure eight-rowed strain and has made the highest yield every year in the North Carolina poor-land test. It is popular in the mountain sections and for early feed and roasting ears throughout the South.

Certified Wood's Improved Golden Dent

Certified Wood's Improved Golden Dent

Matures in 120 days; roasting ears in 85 days; 8½ feet tall. The most popular early feed and roasting ear corn in the South. Extra large, deep golden grain. The most beautiful of all corns. Earliest maturing corn with flinty weevil-resistant grain, and long protecting shuck. Dependable yield under most adverse conditions. Makes a full crop planted after early potatoes. Superior for early hogging down. Our new improved strain was the highest yielding yellow corn in the 1932 North Carolina Coast Experiment Station test; in the Georgia Coast Experiment Station eight-year test, and in the Virginia Coast Experiment Station four-year test, yielding as high as 91 bushels per acre.

Wood's 90-Day Golden Flint Roasting ears 65 days, matures hard corn in 90 days; stalk 8½ feet tall. It makes an extra heavy yield for such an early corn. Ears 12 to 13 inches long, very sound, deep golden color. Eight rows of large, broad grain on a small cob. It is not a sugar corn like Golden Bantam, but the delicious roasting ears resemble that variety but are twice as long, and it yields many times as many ears. Planted on our farm the middle of August, it made roasting ears before frost. It thrives in cold weather that will retard or kill other corns. It is an excellent variety for high mountain sections, or to plant very early in the spring or late in the summer for roasting ears or quick feed.

T. W. Wood & Sons give no warranty, express or implied, as to description, quality, productiveness or any other matter of any Seeds, Bulbs or Plants they send out, and will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned and amount paid for them will be refunded.
